An Account of a Flare Related Shock Event Recorded by the
Energetic Particle Detector EPONA of the Giotto Spacecraft
During September 1985 (STIP Interval XVIII)

The Energetic Particle Detector EPONA of Abstract on the Giotto
Mission to Halley's Comet was designed to measure electrons, protons and
heavier ions ($E > 20$ keV) in the Comet Halley environment and during the
Cruise Phase of the Mission (EPONA switch on : 22 August 1985 - Halley
Encounter; 13 March 1986). In September 1985 (STIP Interval XVIII) a well
defined shock event was recorded at EPONA in association with a sequence of
solar flares and a preliminary account of this event is presented.
